Problem 1

Throw $n = 7$ balls into $k = 7$ boxes. Find the probability that:

a. there are 3 balls in one of the boxes;

b. there are 3 balls in one of the boxes given there are exactly two empty boxes.

Problem 2

In a bin, there are r red balls and b blue balls. Suppose I take the balls out, one by one (i.e. without replacement), until there are no more red balls in the bin. Let X denote the number of balls taken out. Find $\mathbb{E}(X)$.

Problem 3

A p-coin is a coin that lands heads with probability p. Flip a p-coin n times. A "run" is a maximal sequence of consecutive flips that are all the same. For example, the sequence $HTHHHTTH$ with $n = 8$ has five runs, namely H, T, HHH, TT, H. Let X denote the number of runs in these n flips. Find $\mathbb{E}(X)$.

Problem 4

Toss a p-coin n times. Let W_r refer to the number of trial until the r_{th} head. Find $Corr(W_1, W_r)$.
